## Easy to use and afford.

**Plug and play technology.** Designed for simplicity of operation, simply plugs into any of the seven different Telrad Connegy stations and you're ready to go. **SynopSys 6.0** automatically recognizes the particular station, so there's no need for individual station programming. **Price/Performance.** **SynopSys 6.0** is the only system in its class that gives you both technological sophistication and real world affordability.

## A bit about Digital quality.

**Digital Signal Processing.** The digital platform of the **SynopSys 6.0** is state-of-the-art. This means you are provided with an exceptionally performing system, which guarantees the best digital sound quality there is. The **SynopSys 6.0** platform is always ready for future enhancements and technological developments making it virtually obsolescence proof.

## Modular design for easy migration.

The software isn't the only thing about **SynopSys 6.0** that makes upgrading easy and cost-effective. The Telrad Connegy stations themselves will not become obsolete as your needs change. All seven stations in the line are compatible with Telrad Connegy's larger Digital KeyBx, Digital 400 and Digital 1000 systems, so when the time comes for you to upgrade, most of your investment is protected.

## Advanced features mean reduced costs.

**Programming.** Customization couldn't be easier since the system can be programmed from any display station rather than a PC.

**Flash memory upgrades.** **SynopSys 6.0** signals the end of hardware upgrades. Its advanced digital platform allows for improvements to be implemented simply by installing new software, while setting the stage for remote upgrades via modem, downloaded directly into your system.

**Offhook Voice Announce with Hands-Free Answerback.** This feature notifies you of another call when you are on the phone, enabling you to take—rather than return—costly long distance calls.

**Station Message Detail Recording.** SMDR provides useful cost control data, such as where employees are calling and the duration of calls.

**Power Failure Transfer Capability.** This feature, built in to the SynopSys system, allows you to continue making essential calls when building power fails.
